# GALL MIDGES OF ASTER, CARYA, QUERCUS AND SALIX

By E. P. Felt, Albany, N. Y.

The following tabulation of the species reared from the above named plants will prove of service in identifying the midges occurring thereupon. It is extremely interesting to compare the 18 species occurring upon aster with the 35<sup>1</sup> found living at the expense of solidago. It is probable that these lists represent conditions with a fair degree of accuracy, since the data in both instances has been obtained very largely by collections on asters and solidagos in the vicinity of Albany, N. Y., and also at Magnolia, Mass. The tabulation of hickory species shows that many of the midge galls occurring upon this plant are produced by Caryomyia, a peculiar and extremely interesting genus which appears to be restricted to this food plant. The same is true in large measure of Quercus and Cincticornia, this latter Cecidomyiid genus probably being confined to the oaks.

The willow, with its dominance in certain localities and numerous species, is also extremely interesting, since it affords sustenance to about 46 species of gall midges, some 5 living upon the leaves, 13 producing bud galls of various kinds, which, in turn, are inhabited by 7 other species, mostly inquilines. There are, in addition, 21 species infesting the twigs, a number of these occurring in the slender, very slightly enlarged twigs and hardly producing a gall. A few excavate galleries in the wood, while the majority work in the subcortical tissues. The willow is a marked favorite with Rhabdophaga, members of this genus producing conspicuous bud and twig galls. Several species of Mayetiola are also found and in one instance at least species belonging to two genera were reared from the same twig.

#### Aster

#### Flower or Bud Galls

Aborted head on Aster patens. Adult, length 4 to 5 mm., dark brown, easily recognized by the broadly, white-banded tarsi.

Asphondylia moracha O. S.

Dwarfed or stunted flower heads on Aster paniculata. Female, length, 2.5 mm., reddish brown; 19 antennal segments, the fifth with

<sup>&</sup>lt;sup>1</sup>1909, Felt, E. P. Gall Midges of the Goldenrod, Ottawa Naturalist, 22: 245-49.

a stem one fifth the length of the cylindric basal enlargement, which latter has a length 2½ times its diameter.

Rhopalomyia asterifloræ Felt.

Axillary bud galls on Aster lateriflorus, diameter 10 mm. Male, length 1.5 mm., fuscous yellowish; 18 antennal segments, the fifth with a stem as long as the basal enlargement, which latter has a length one half greater than its diameter. Female, length 3 mm., reddish orange; 20 antennal segments, the fifth with a stem one fifth the length of the basal enlargement.

Rhopalomyia lateriflori Felt.

Blister galls

### Leaf Galls

Gall yellowish, shining, oval, diameter 6 to 7 mm. Female, length 2 mm., abdomen dark brown, the segments narrowly white margined; antennal segments 22, the fifth with a length three quarters its diameter, palpi biarticulate. Asteromyia nitida Felt.

Gall pinkish, large, oval blotches on Aster divaricata, diameter 10 to 12 mm. Male, length 2 mm., abdomen dark brown, the basal segment sparsely white margined laterally and posteriorly; antennal segments 16, the fifth with a length twice its diameter, palpi uniarticulate. Female, length 2 mm., abdomen dark brown, the segments with submedian white spots; antennal segments 16.

Asteromyia divaricata Felt.

<sup>&</sup>lt;sup>1</sup> Asteromyia n. g. This new genus is erected for certain American species previously supposed to be referable to Baldratia Kieff. Type *Lasioptera carbonifera* Felt.

- Gall yellowish or brownish, irregularly oval, diameter 6 mm.; on Aster paniculata. Male, length 2 mm., abdomen dark purplish brown; antennal segments 14, the fifth with a length one half greater than its diameter, palpi uniarticulate.

Asteromyia paniculata Felt.

- Gall sooty yellow beneath, dirty white above, length 2 cm., diameter 1.2 cm. Female, length 2 mm., abdomen black, the segments with submedian white spots; antennal segments 16, the fifth with a length hardly equal to its diameter, palpi uniarticulate.

Asteromyia flavomaculata Felt.

Gall yellowish white, dark margined, diameter 3 mm. Female, length 2 mm., abdomen black, the segments sparsely white margined; antennal segments 18, the fifth with a length three quarters its diameter, palpi biarticulate.

Asteromyia asterifolia Beutm.

#### Stem or Branch Galls

Gall a small, pustulate swelling on aster stems, diameter 3 mm. Male, length 2 mm., abdomen dark brown, the segments with submedian, lunate, white spots; antennal segments 14, the fifth with a length a little greater than its diameter, palpi uniarticulate.

Asteromyia pustulata Felt.

Fusiform stem or branch gall, length 1 cm., diameter .4 cm. Male, length 2.75 mm., abdomen dark brown, the segments with submedian, white spots; antennal segments 19, the fifth with a length greater than its diameter. Female, length 2.75 mm., abdomen dark

brown or black with submedian, white spots; antennal segments 21, the fifth with a length hardly equal its diameter.

Neolasioptera ramuscula Beutm.

Ovate, sessile, brownish galls densely white haired, length 7 mm., on Aster crassulus. Male, length 1.5 mm., abdomen dark brown basally, lighter distally; 18 antennal segments, the fifth with a stem three quarters the length of the basal enlargement, which latter has a length nearly twice its diameter, palpi biarticulate.

Rhopalomyia crassulina Ckll.

## Carya (Hickory)

 $Leaf\ Galls$ 

Cylindric galls.

Greenish or black, 4 to 5 mm. long, 1 mm. in diameter.

Caryomyia tubicola O. S.

Conieal galls.

Globose galls.

-Smooth or nearly so.

Nearly smooth, thin-walled yellowish green or brown, sparsely haired, usually with a slight nipple, diameter 2 mm.

Caryomyia caryæ O. S.

<sup>&</sup>lt;sup>1</sup> Schizomyia caryæcola Felt was supposed to have been reared from this gall. The one or two specimens obtained were probably accidental.

Thin-walled, probably similar to the above.

Caryomyia arcuaria Felt.

Thin-walled without the nipple of Caryomyia carya, with a yelowish pubescence, diameter 2 to 4 mm... Caryomia similis Felt. Thick-walled, yellowish green or brown, diameter 4 to 5 mm.

Caryomyia antennata Felt.

Thin-walled with a false chamber at the apex, diameter 2 to 3 mm.

\*Caryomyia inanis\* Felt.

Hairy.

Thin-walled, rust red, hairs long, straight, diameter 2 to 4 mm.

Caryomyia holotricha O. S.

Gall similar to the above, the midge probably inquiline.

Mycodiplosis holotricha Felt.

Thin-walled, long haired, melon-shaped, diameter 2 to 3 mm.

Caryomyia thompsoni Felt.

Midrib gall.

A rounded, irregular, pale yellowish, hard swelling 12 mm. long.

\*Caryomyia cynipsea O. S.\*\*

Forming no gall.

An irregular, yellowish brown margined elevation, diameter 3 mm. Larva attached by a viscid secretion. Caryomyia<sup>2</sup> glutinosa O: S. Swellings in Husks

Irregular swelling in the husks produced by pale reddish larvæ.

\*Caryomyia\* nucicola\* O. S.

## Quercus (Oak)

## Fruit

Reared from larvæ found between the seed coats of an acorn. Female, length 1 mm., abdomen yellowish brown; antennal segments 14, the fifth with a length about 2½ times its diameter.

Dasyneura glandis Felt.

#### Flower Galls

Reared from undescribed galls on blossoms of oak. Female, length 1.5 mm., abdomen reddish brown, the basal segment white, the

<sup>&</sup>lt;sup>1</sup>This species was apparently reared from the gall of Caryomyia inanis and that of C. persicoides.

<sup>&</sup>lt;sup>2</sup> The reference of this larva to Caryomyia is provisional only.

others with submedian, white spots; antennal segments 33, the fifth with a length three quarters its diameter.

Lasioptera quercifloræ Felt.

Lcaf Galls

Leaf edge galls.

Gall a folded leaf edge between serrations. Female, length 1.5 mm., abdomen deep red; antennal segments 14, the fifth with a length 2½ times its diameter...Cecidomyia foliora Rssl. & Hkr. Similar gall, possibly identical.....Cecidomyia erubescens O. S. Vein galls.

A narrow, dark purplish, fusiform, thin-walled swelling on the under side of the mid or lateral veins may contain two or more orange larvæ, length 8 mm. Male, length 2 mm., abdomen reddish or dark brown; antennal segments 14, the fifth with a length nearly four times its diameter. Female, length 2.5 mm., abdomen dark brown, the fifth with a length four times its diameter.

Cincticornia podagræ Felt.

Gall very similar to, if not identical with the above.

Cincticornia majalis O. S.

An elongate fold gall close to the midrib on the under surface, length 12 mm., diameter 1 mm.; on Quercus tinctoria.

Cecidomyia q-oruca Walsh.

A large midrib fold with a conspicuous white pubescence.

Cecidomyia niveipila O. S.

Globose or subglobose, thickened, usually reddish, galls.

Reddish, oval, irregular, wrinkled leaf gall, diameter 3 to 4 mm. Male, length 3 mm., abdomen dark brown; antennal segments 14. Female, length 3.5 mm., abdomen dark red; antennal segments 14, the fifth with a length about  $2\frac{1}{2}$  times its diameter.

Cincticornia pilulæ Walsh.

Gall similar to though much smaller than that of Cinciticornia pilulæ. Female, length 1.25 mm., abdomen a nearly uniform dark reddish brown; antennal segments 18, the fifth with a length a little greater than its diameter.........Dasyneura florida Felt. Reared from oak, presumably from a gall resembling that made by Cynips. Male, length 1 mm., abdomen light yellowish with a dark fuscous spot dorsally on the third and fourth segments; antennal segments 14, the fifth having the basal portion of the stem with a length about four times its diameter, the distal part with a length five times its diameter.

The codiplosis quercifolia Felt.

A subhemispheric, brown, slightly nippled, monothalamous gall on the under side of the leaf, diameter 1.75 mm. Male, length 2 mm., abdomen dark brown; 14 antennal segments, the fifth with a length about three times its diameter. Female, length 2 mm., abdomen reddish orange, the fifth antennal segment with a length fully 4 times its diameter....Cincticornia globosa Felt. Flat, inconspicuous galls.

A flat, relatively inconspicuous, probably blister gall. Male, length 1.5 mm., abdomen dark reddish brown; 14 antennal segments, the third with a length about twice its diameter. Female, length 1.5 mm., abdomen reddish brown, the third antennal segment with a length twice its diameter. Cincticornia quercifolia Felt.

A slight circular, blister-like swelling on the lateral veins, length 3 mm., diameter 1 mm. Male, length 2.5 mm., abdomen mostly yellowish orange; antennal segments 14, the fifth with a length three times its diameter. Female, length 2 mm., abdomen with the sclerites dark brown, the membrane and pleuræ deep orange, the fifth antennal segment with a length 2½ times its diameter.

Cincticornia americana Felt.

A broadly, yellow margined, circular, blister gall, diameter 3 mm. Male, length 2 mm., abdomen dark brown; antennal segments 14, the fifth with a length about 4 times its diameter.

Cincticornia serrata Felt.

A variable brown, irregularly oval, pustulate swelling 5 to 6 mm. in diameter. Male, length 2 mm., abdomen deep reddish orange; 14 antennal segments, the fifth with a length about three times its diameter. Female, length 2 mm., abdomen dark brown, the fifth antennal segment with a length four times its diameter.

Cincticornia pustulata Felt.

 

# Twig Galls

Reared from twigs of white oak, Quercus alba. Female, length .75 mm., abdomen dark brown, the first segment dorsally silvery white, the second to fourth with submedian white spots; antennal segments 28, the fifth with a length about three quarters its diameter.

Lasioptera querciperda Felt.

## Salix (Willow)

## Leaf Galls

Fusiform pod or curled leaves, length 10 mm.

Dasyneura salicifolia Felt.

Oligotrophus salicifolius n. sp.¹

Subconic, truncate, greenish yellow, lipped gall, diameter 2 mm.

Hormomyia verruca Walsh.

Apparently reared from same gall........Clinorhyncha filicis Felt.

## Bud Galls

Rhabdophaga normaniana Felt.

Large, loose, rosette gall, length 1 to 2 cm.

Rhabdophaga rhodoides Walsh.

Large, open, rosette, or cabbage, gall, diameter 1 to 2 cm.

Rhabdophaga brassicoides Walsh.

<sup>&</sup>lt;sup>1</sup> Male: Length 2 mm., antennal segments 14, the fifth with a stem as long as the basal enlargement, which latter has a length twice its diameter. Mesonotum dark reddish, postscutellum fuscous. Scutellum and abdomen reddish yellow. Legs fuscous straw. Female: Length 2.25 mm., the fifth antennal segment with a length 2½ times its diameter. Abdomen deep red.

Reared from above gall	Dasyneura atricornis Walsh.
Reared from above gall	Cecidomyia atrocularis Walsh.
Reared from above gall	Dasyneura albovittata Walsh.
Reared from above gall	Lestodiplosis decemmaculata Walsh.
Pine-cone gall resembling a slender	R. strobiloides gall.
	Rhabdophaga persimilis Felt.
Ovate, terminal bud gall, diameter	1 cm.
	Rhabdophaga gnaphaloides Walsh.
Small bud gall	Dasyneura californica Felt.
Small bud gall	Rhabdophaga gemma Felt.
Reared from apparently normal bu	idRhabdophaga latebrosa Felt.
Small, conic, apical bud gall	Dasyneura gemma Felt.

### Twia Galls

Reared from willow twigs, gall undescribed.

Asphondylia salictaria Felt.
Larvæ in subcortical cells, no swelling Dasyneura corticis n. sp. 1
Slender twigs, slightly enlärgedSackenomyia packardi Felt.
Slender twigs, slightly enlargedSackenomyia portera Ckll.
Slender twigs, slightly enlarged
Slender twigs, slightly enlargedRhabdophaga caulicola Felt.
Twigs probably hardly enlarged
Slender twigs, slightly enlarged
Twigs uniformly enlarged, gall 5 to 7 cm. long.

Rhabdophaga podagræ Felt.

Gall similar to above, cells in wood.....Rhabdophaga cornuta Walsh. Twigs irregularly enlarged, galls 1 to 3 cm. long.

Rhabdophaga salicis Schr.

Twigs irregularly enlarged, gall 1 to 3 cm. long, buds dwarfed.

Rhabdophaga triticoides Walsh.

Apical, fusiform, beaked gall, length 2 cm.... Mayetiola rigida O. S. 

Nodular gall at base of twig, length 8 mm.

Rhabdophaga nodulosa Walsh.

Inconspicuous knot or twig enlargements. . Mayetiola latipennis Felt.

<sup>&</sup>lt;sup>1</sup> Male: Length 2 mm., antennal segments 16, the fifth with a stem three fourths the length of the cylindric basal enlargement, which latter has a length twice its diameter. Mesonotum dull black. Scutellum fuscous yellowish, postscutellum a little darker. Abdomen dull reddish orange. Legs a variable fuscous yellowish. Female: Length 1.75 mm., 15 antennal segments, the fifth with a length 21/2 times its diameter. Mesonotum dull brown. Abdomen deep red.

Subglobular, lateral gall with dead area on one side, diameter 9 mm. Rhabdophaga globosa Felt.

Irregular, ovoid or subglobular galls, diameter 1 to 2 cm.

Rhabdophaga batatas Walsh.

Mayetiola tumidosæ Felt.

# SOME NEW SPECIES OF WEEVILS OF ECONOMIC IMPORTANCE

By W. Dwight Pierce, U. S. Bureau of Entomology, Dallas, Texas

I beg the indulgence of my colleagues for combining in a single article purely taxonomic matter with a discussion of biologic and economic subjects. My plea is that the course I follow shows in a rather striking manner the close interrelationship between the economic and systematic branches of our science.

In a recent publication on the "Parsley Stalk Weevil (Listronotus latiusculus Boh.)," Dr. F. H. Chittenden cites examples of serious damage done by the semi-aquatic weevils Listronotus appendiculatus Boheman and Notaris puncticollis LeConte to cabbage in Ohio, and by Listronotus latiusculus Boheman to parsley in Virginia. He cites in addition, the tendency of the genus Sphenophorus to attack corn (Bur. Ent., bul. 82, part II, p. 14). These are all examples of the results of planting crops on newly drained land, when weevils which normally inhabit marshes have depredated on cultivated crops.

This brief notice describes a phenomenon in the biologies of weevils which is by no means uncommon, although perhaps not well understood as yet.¹ There are among our American weevils several very sharply defined groups of forms without wings or with rudiments of wings only. The classification of LeConte and Horn overlooks this important character and by raising other characters to primary importance has obscured it and dissociated what appear to the writer to be nearly related forms. The majority of these wingless weevils pass their developmental period in the ground at the roots of plants. Whenever it happens that land is cleared, and the plants eliminated have been the hosts of multitudes of these weevils, it is almost certain

<sup>&</sup>lt;sup>1</sup>This paper deals only with weevils, however workers in other groups will recognize the existence of the same phenomenon.
